

Cartostrip Stripping Devices – Since 2008

Cartostrip Ltd., founded in 2008, revolutionized the stripping process in the folding carton and corrugated industries. Its Cartostrip product, featuring a powerful motor and two-handed operation, ensures safe and efficient stripping. Remarkable cost savings and improved productivity makes Cartostrip a must-have in today's production environment.

Safety Risks

The Cartostrip machine has become a target for imitation by various sub-par engineering operations in China and India. These imitation machines are being sold at low prices, which may initially seem appealing to potential buyers.

However, purchasers of these knockoff products quickly find themselves filled with regret for several reasons. Firstly, these machines are constructed with lightweight materials, resulting in reduced durability and reliability compared to genuine Cartostrip devices. Moreover, they are ergonomically challenging to use. Yet, the most significant concern revolves around safety.

The cost to an employer in the event of an injury caused by a cheap and unsafe machine far outweighs the expense of purchasing a better and safer alternative. Cartostrip is bound by the European CE marking system that guarantees machines have undergone testing and meet the required standards. In contrast, the cheap imitations often lack proper marking, or worse, bear false markings.

The Cartostrip device is the sole HSE-approved (equivalent to OSHA) hand-held stripping device, featuring appropriate guards and a two-handed operation. The authorities are even considering a ban on machines that can be operated with a single hand, not to mention those equipped with long teeth on the stripping chains.

While a machine priced at half the cost of the Cartostrip tool may initially seem enticing, it poses significant risks to operators and those in their vicinity. These risks can easily be avoided. Remember, buying cheap now may result in purchasing twice and facing substantial injury claims. It truly represents a false economy, especially when our machine will likely pay for itself within a few months.

Ask yourself: is it truly worth taking such a risk?

Even if customers decide not to purchase from us, we believe it is our responsibility to inform them and prospective buyers about the ongoing situation.

Why Cartostrip is the Right Choice

Cartostrip machines are made in the U.K. to the highest standard for safety, reliability and durability and have set the bar when it comes to industry standards. As they say, "We are often copied but never bettered".

The use of a hand held stripper is of enormous benefit to both the company and its operators:

- Reduce stripping labor costs by 85%
- Reduce the risk of operator injury
- As blanks are cleaner, it improves gluer through-put or assembly
- Improves working conditions
- Return on investment within a few months of purchase
